

CellPlayer™ Angiogenesis PrimeKit VEGF/Suramin Supplement

EsSEN BioScience Catalog Number: 4437

Presentation and Storage

The CellPlayer Angiogenesis PrimeKit VEGF/Suramin Supplement Kit is composed of two vials; 1) VEGF (250µL) is supplied at a concentration of 2µg/mL in PBS containing 0.1% BSA, and 2) suramin (200µL) is provided at a concentration of 2mM in growth media. This kit is shipped on dry ice and, if stored at -20 °C, is stable until expiration date indicated on the respective vials. When stored at 4 °C the shelf life is 2 weeks from date of thaw.

Background and Intended Use

The CellPlayer Angiogenesis PrimeKit VEGF/Suramin Supplement Kit contains VEGF and suramin, which are known to have opposite effects on angiogenesis. Suramin, among other activities, is a known inhibitor of angiogenesis that is believed to occur by blocking growth factor binding to its cognate receptor. VEGF is a well-characterized growth factor known to maintain blood vessel development and has been shown to promote angiogenesis.

Biological Activity

The Suramin and VEGF preparations included in the VEGF/Suramin Supplement Kit have been validated for use with the Angiogenesis PrimeKit and effects have been shown to be concentration dependent.

Recommended Use

VEGF

We recommend that VEGF be used at a final concentration of 4ng/mL (1:500 dilution of stock), diluted in assay medium, and added directly to the cells in culture. The amount of VEGF supplied is sufficient to feed the entire plate for six feedings. To make up sufficient reagent at the working concentration for an entire plate, add 36µL to 18mL assay media (14.4mL media required to feed the entire plate at 0.15mL/well).

Suramin

We recommend that suramin be used at a final concentration of 100µM (1:20 dilution of stock), diluted in assay medium **containing 4ng/mL VEGF**, and added directly to the cells in culture. Due to the low endogenous tube formation in basal media alone, to observe Suramin-mediated inhibition of angiogenesis it must be added in the presence of growth factor. The amount of suramin supplied is sufficient to feed **four wells** at 100µM for six feedings. To make up sufficient reagent at the working concentration for four wells, add 32.5µL to 0.65mL growth media + VEGF.

For the full effects to be observed, the reagents should be added with every change of media throughout the course of the assay. We recommend adding 0.15mL/well at the working concentration.
